The Lexical Basis of Sentence Processing

The contrast with the most explanatory power indicates that the priming effect of the same verb (when prime and target verbs are identical) than across different verbs (Pickering & Branigan, 1998). Syntactic priming is stronger across the same verb (when prime and target verbs are identical) than across different verbs (Pickering & Branigan, 1998). Is semantic category psychologically valid? Is there a semantic category level of representation in the mental lexicon?
